

Case Study

Wireless Automotive Diagnostic Systems with SENA Bluetooth OEM Module

Description

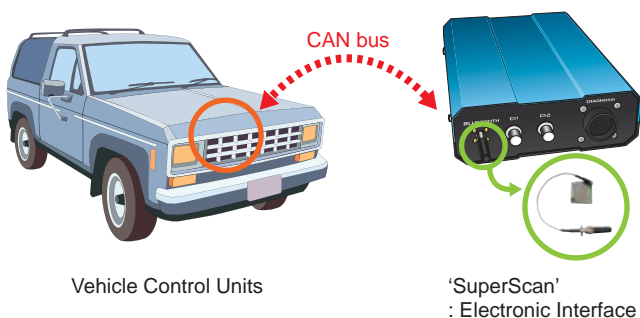

The SuperScan is a diagnosis scanner made using Parani-ESD110. The SuperScan acts as a gateway between the vehicle's control units and the diagnostic software running on a PC.

The product is a diagnosis scanner designed to test different control units (ABS, Airbag, Engine, Body Systems, etc.) on different manufacturers. It allows a mechanic to retrieve stored fault codes, read live data parameter (like temperatures, pressures, voltages, switches, etc.), activate components, and perform different programming and configuration functions on each of the vehicle's control unit.

Customer information:

- Name: DEC Automotive

How it works

Many diagnostic data are sent from Vehicle Control Units to the SuperScan through CAN bus protocol. SENA Bluetooth OEM module, Parani-ESD110 is used for the Bluetooth module of SuperScan.
